

Next-Generation Network For the Island of Tonga

A new communications service provider needed a multi-service IP network to provide 21st century voice, data and entertainment services to subscribers through-out the Kingdom of Tonga.

Globecomm designed and continues to implement an IP-based telecommunications network that integrates satellite, terrestrial

microwave, GSM cellular, fixed wireless, and digital television broadcast technologies. The network provides high-speed Internet access to consumers as well as corporate/government entities, private data services, GSM telephone services, and video and audio entertainment services on a subscription basis. In addition to

establishing the telecommunications infra-structure and Internet connections, we are also providing the connection to the international public switched telephone network (PSTN). Globecomm handles the billing and subscriber management systems for all services, while providing ongoing network operations and maintenance support.
